1

Two stars of mass M and 4M are at a distance d between their centres.

The resultant gravitational field strength is zero along the line between their centres at a distance y from the centre of the star of mass M.

What is the value of the ratio $\frac{y}{d}$?

- A $\frac{1}{2}$
- 0

EPT - video walk through available

- B $\frac{1}{3}$
- 0
- c $\frac{2}{3}$
- 0
- D $\frac{3}{4}$
- 0

A geosynchronous satellite is in a constant radius orbit around the Earth. The Earth has a mass of 6.0×10^{24} kg and a radius of 6.4×10^6 m.

What is the height of the satellite above the Earth's surface?

- **A** $1.3 \times 10^7 \,\mathrm{m}$
- **B** $3.6 \times 10^7 \,\mathrm{m}$
- **C** $4.2 \times 10^7 \,\mathrm{m}$
- **D** $4.8 \times 10^7 \,\mathrm{m}$

- The planet Venus may be considered to be a sphere of uniform density 5.24×10^3 kg m⁻³. The gravitational field strength at the surface of Venus is 8.87 N kg⁻¹.
 - (a) (i) Show that the gravitational field strength g_s at the surface of a planet is related to the the density ρ and the radius R of the planet by the expression

$$g_{z} = \frac{4}{3}\pi GR\rho$$

where G is the gravitational constant.

(2)

(ii) Calculate the radius of Venus.

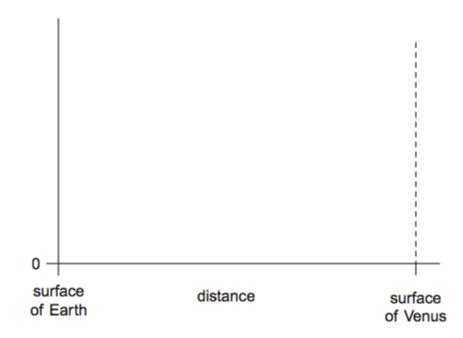

Give your answer to an appropriate number of significant figures.

(3)

(b) At a certain time, the positions of Earth and Venus are aligned so that the distance between them is a minimum.

Sketch a graph on the axes below to show how the magnitude of the gravitational field strength g varies with distance along the shortest straight line between their surfaces. Consider only the contributions to the field produced by Earth and Venus. Mark values on the vertical axis of your graph.

gravitational field strength / N kg⁻¹
