6 The diagram shows the apparatus Fizeau used to determine the speed of light.

The following observations are made.
A When the speed of rotation is low the observer sees the light returning after reflection by the mirror $\mathbf{M}$.

B When the speed of the wheel is slowly increased the observer continues to see the light until the wheel reaches a certain speed. At this speed the observer cannot see the light.
(a) Explain these observations.

Observation A
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
Observation B
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(b) The table shows data from Fizeau's experiment at the instant when observation B is made.

| $d$, distance from $\mathbf{M}$ to $\mathbf{W}$ | 8.6 km |
| :--- | :---: |
| $f$, number of wheel revolutions per second | 12 |
| $n$, number of teeth in the wheel | 720 |

It can be shown that the speed of light $c$ is given by the equation

$$
c=4 d n f
$$

Discuss whether the data in the table are consistent with the present accepted value for the speed of light.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(c) The speed of the wheel is further increased.

Deduce the value of $f$ when the observer would next be unable to see light returning from the mirror.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(d) Explain how the nature of light is implied by Maxwell's theory of electromagnetic waves and Fizeau's result.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

The diagram shows the main parts of a transmission electron microscope (TEM).

9 Cosmic rays detected on a spacecraft are protons with a total energy of $3.7 \times 10^{9} \mathrm{eV}$.
Calculate the velocity of the protons as a fraction of the speed of light.
proton velocity = $\qquad$ $c$

10 A student carries out an experiment to determine the diameter of a cylindrical wire based on the theory of Young's double-slit experiment, using the arrangement shown in Figure 1.

Figure 1

The wire is mounted vertically in front of a single narrow slit which is illuminated by monochromatic light. The wire produces a shadow between points $\mathbf{P}$ and $\mathbf{Q}$ on a glass slide covered with tracing paper. The light diffracts as it passes the wire. Points $\mathbf{A}$ and $\mathbf{B}$ act as coherent sources causing interference fringes to be seen between $\mathbf{P}$ and $\mathbf{Q}$.

The student uses a metre ruler to measure the distances $L$ and $D$ shown in Figure 1. Figure 2 shows the pattern of interference fringes between $\mathbf{P}$ and $\mathbf{Q}$. The student takes readings from a vernier scale to indicate the positions of the centres of two of the fringes.

Figure 2

The student's measurements are shown in Table 1.
Table 1

| $\boldsymbol{L} / \mathbf{m m}$ | $\boldsymbol{D} / \mathbf{m m}$ | $\mathbf{R 1} / \mathbf{m m}$ | $\mathbf{R 2} \mathbf{/ m m}$ |
| :---: | :---: | :---: | :---: |
| 46 | 395 | 8.71 | 11.16 |

(a) Determine the spacing of the interference fringes $w$ using Figure 1 and the data in Table 1.

Give your answer to an appropriate number of significant figures.
w $\qquad$ m
(b) Determine the diameter $d$ of the wire. wavelength of the monochromatic light $=589.3 \mathrm{~nm}$

$$
d=\ldots \mathrm{m}
$$

(c) Estimate the number of interference fringes seen between $\mathbf{P}$ and $\mathbf{Q}$.
number of interference fringes = $\qquad$
(d) The student uses a micrometer screw gauge to confirm his result for $d$.

Describe a suitable procedure that the student should carry out before using the micrometer to ensure that the measurements are not affected by systematic error.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(e) To reduce the impact of random error, the student takes several measurements of the diameter at different points along the wire so that he can calculate a mean value for $d$. These measurements are shown in Table 2.

| $d / \mathrm{mm}$ |
| :---: |
| 0.572 |
| 0.574 |
| 0.569 |
| 0.571 |
| 0.566 |
| 0.569 |

Use the data from Table 2 to determine the percentage uncertainty in the student's result for $d$.

$$
\text { percentage uncertainty }=\ldots \quad \%
$$
