

Moles

02 March 2020 10:25

Everyone loves moles.

Moles are so important they even make a guest appearance in A Level Physics...

A mole is just a number. Like 'kilo' just means 1000.

A mole is 6.02×10^{23} so... Its a pretty flipping big number. It always takes students a bit of time to get their head around the fact that it is just a number.

Moles and Particles

In chemistry it is often a number of particles. So when we say 1 mole of atoms we mean a pile of 6.02×10^{23} atoms. So a big pile. We could in theory at least, have a mole of anything. But a pile containing 1 mole of, shall we say, tennis balls, would be stupidly big. Imagine a pile of 6.02×10^{23} tennis balls ...

So why all the fuss?

Well the big deal is that it links really well with the periodic table and A_r (and M_r)

The Periodic Table

Periods	Group 1	Group 2	Group 3	Group 4	Group 5	Group 6	Group 7	Group 0
1								4 He Helium 2
2	7 Li Lithium 3	9 Be Beryllium 4	11 B Boron 5	12 C Carbon 6	14 N Nitrogen 7	16 O Oxygen 8	19 F Fluorine 9	20 Ne Neon 10
3	23 Na Sodium 11	24 Mg Magnesium 12	27 Al Aluminium 13	28 Si Silicon 14	31 P Phosphorus 15	32 S Sulfur 16	35.5 Cl Chlorine 17	40 Ar Argon 18

It turns out that the Ar in grams will contain 6.02×10^{23} atoms.

Pick an element - carbon. It has a Ar of 12. So if we have 12g of carbon atoms we will in fact have 6.2×10^{23} carbon atoms. For sodium (Na) the Ar is 23 - so we need 23g of carbon to have 6.02×10^{23} atoms.

And For Molecules....

Remember that 1 Mole (6.02×10^{23}) is a pile of particles. The examples above are for sodium and carbon atoms. But it also works really well for molecules from the M_r

Take CO_2 again. It has an M_r of $12 + 16 + 16 = 44$. This means that 1 mole of CO_2 will have a mass of 44g. So if we had a pile of CO_2 gas that had a mass of 44g you would have ... wait for it... 6.02×10^{23} molecules.

You might well remember that gasses go round in pairs.... So what would the mass of a mole of F_2 be? Ar F is 19 ... But don't forget the pairs F doesn't exist on its own - but rather F_2 . So the mass of a mole of Fluorine gas would be $2 \times 19 = 38\text{g}$.

You will be asked to find the number of moles in a given mass.

$$\text{Number of moles} = \frac{\text{mass in g (of an element or compound)}}{M_r \text{ (of the element or compound)}}$$

Learn this. It is 99% likely to come up.

Example..... You have 50g of Sulfuric acid (H_2SO_4). How many moles of sulphuric acid is this ?

$$A_r: \quad \text{H} = 1, \quad \text{S} = 32, \quad \text{O} = 16$$

$$M_r = 2 \times 1 + 32 + 4 \times 16 = 98$$

$$\text{So... 1 mole of } \text{H}_2\text{SO}_4 \equiv 98\text{g.}$$

$$\text{So... we have } \frac{50}{98} \text{ moles} = \underline{\underline{0.51}} \text{ moles}$$
